                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Chim. Biophys. Acta 1040:287-293(1990).

FUNCTION: THE ENZYMES WHICH CATALYZE THE REVERSIBLE PHOSPHORYLOSIS OF PYRIMIDINE NUCLEOSIDES ARE INVOLVED IN THE DEGRADATION OF THESE COMPOUNDS AND IN THEIR UTILIZATION AS CARBON AND ENERGY SOURCES, OR IN THE RESCUE OF PYRIMIDINE BASES FOR NUCLEOTIDE SYNTHESIS.

OR IN THE RESCUE OF PYRIMIDINE BASES FOR NUCLEOTIDE SYNTHESIS.

ORTALYTIC ACTIVITY: Thymidine + phosphate = thymine + 2-deoxy-D-
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    SIMILARITY: BELONGS TO THE THYMIDINE/PYRIMIDINE-NUCLEOSIDE PHOSPHORYLASES FAMILY. , S11384; S11384.

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

```
thymidine phosphorylase (EC 2.4.2.4) - Lactobacillus W,Alternate names: pyrimidine phosphorylase C;Species: Lactobacillus casei C;Date: 19-Mar-1997 #sequence_revision 26-Feb-1998 #t C;Accession: S11384
                                                                    A;Experimental source: strain ATCC 7469
A;Note: this protein was shown to possess thymidine phosphorylase C;Superfamily: glyceraldehyde-3-phosphate dehydrogenase C;Keywords: glycosyltransferase; homodimer; pentosyltransferase
                                                                                                                                                                                                                                                                                                                                                                                                                                                         밁
